NIFTY 15-MIN WEEKLY OPTION BUYING STRATEGY

1. Pre-Market Routine (09:00 AM)

Check **India VIX** to determine risk allocation before market open:

- **VIX < 12:** High sideways risk. **Cut normal position size by 50%.**
- **VIX 12–18:** Ideal environment. **Trade standard position size.**
- **VIX > 18:** High premium volatility. **Reduce position size significantly.**

2. Indicator Configurations

- **Timeframe:** 15-Minute
- **Supertrend:** Period = 10, Multiplier = 2
- **EMA 1 (Fast):** 9-period, Source = Close
- **EMA 2 (Slow):** 21-period, Source = Close
- **RSI:** 14-period (Mark threshold lines at 55 and 45)
- **ADX:** 14-period (Mark volume/trend strength filter line at 20)

3. Call Option (CE) Execution Rules

Setup Conditions (On 15-Min Candle Close):

1. Supertrend turns **Green**.
2. 9 EMA is completely **above** the 21 EMA.
3. The trigger candle closes decisively **above** both EMAs.
4. RSI is strictly **above 55**.
5. ADX is **above 20** (Must slope up if between 20–30; slope does not matter if > 30).

Order Placement & Management:

- **Strike Selection:** Buy In-The-Money (ITM) contract exactly **100 points below** Nifty Spot.
- **Stop-Loss (SL):** Low of the trigger candle on the Option Premium Chart. Capped at a maximum of **30–35 premium points**.
- **Target:** Strict **1:1.5 Risk-to-Reward Ratio** (e.g., if SL is 30 points, Target is 45 points).
- **Trailing:** Move SL to cost (break-even) once the premium gains a 1:1 risk-equivalent ratio.

4. Put Option (PE) Execution Rules

Setup Conditions (On 15-Min Candle Close):

1. Supertrend turns **Red**.
2. 9 EMA is completely **below** the 21 EMA.

3. The trigger candle closes decisively **below** both EMAs.
4. RSI is strictly **below 45**.
5. ADX is **above 20** (Must slope up if between 20–30; slope does not matter if > 30).

Order Placement & Management:

- **Strike Selection:** Buy In-The-Money (ITM) contract exactly **100 points above** Nifty Spot.
- **Stop-Loss (SL):** High of the trigger candle on the Option Premium Chart. Capped at a maximum of **30–35 premium points**.
- **Target:** Strict **1:1.5 Risk-to-Reward Ratio**.
- **Trailing:** Move SL to cost (break-even) once the premium gains a 1:1 risk-equivalent ratio.

5. Unbreakable Discipline Filters

- **The 4-Candle Rule:** If neither SL nor Target is hit within **60 minutes (4 candles)**, exit at market price instantly to avoid Theta (time) decay.
- **No-Trade Zone:** Do not open fresh positions between **11:00 AM and 01:30 PM** (midday low-volume lull).
- **Expiry Restriction:** Do not trade this strategy after **12:00 PM on Thursdays** due to high Gamma risk.
- **Daily Stop Limit:** Maximum of **2 trades per day**. Shut down your trading terminal immediately if both hit your SL.
